### Other Site Characteristics

Zona di versante e fascia costiera. La costa è rocciosa bassa con strutture tettoniche evidenti. Affiorano formazioni riconducibili all'unità del M. Gottero comprendenti ardesie e facies siltoso arenacea.

### 4.2 Quality and importance

L'interesse del sito deriva dalla presenza in prossimità del mare di elementi floristici relativamente orofili (seppur sempre mediterranei). Accanto ad habitat relativamente aridi sono presenti vallecule fresche, importanti per l'insediamento di popolazioni di anfibi e uccelli. Il sito ha anche importanza dal punto di vista storico architettonico. Sono presenti alcune specie licheniche in via di rarefazione, endemiti e specie protette da convenzioni/direttive internazionali.

### 4.3 Threats, pressures and activities with impacts on the site

The most important impacts and activities with high effect on the site
