#### Other Site Characteristics

Zona di versante caratterizzata da culminazioni, affioramenti rocciosi e aree pianeggianti in quota; sono anche presenti numerosi piccoli rii confluenti nel tratto iniziale del torrente Aveto. Affiorano le arenarie del M. Gottero e argilloscisti alternati a calcareniti.

#### 4.2 Quality and importance

Il sito è costituito da una zona montuosa con scarsa antropizzazione che comprende aspetti di faggeta, sorgenti, torrenti e habitat rocciosi ben conservati. Ospita habitat/specie prioritari per la 92/43 CEE e vari endemiti. Di notevole importanza è la presenza di *Sedum monregalense*, specie rara e ad areale ristretto e frammentato. L'eterogeneità degli habitat, con accostamenti di zone rupestri a praterie, foreste e corsi d'acqua, favorisce l'insediamento di una ornitofauna ricca di specie appartenenti agli anelli superiori delle catene alimentari. Il sito ospita anche un endemita vulnerabile e indicatore di qualità (*Nebria tibialis tibialis*) proposto dalla Regione Liguria per l'inserimento nell'allegato II della 92/43 CEE.
